

Clutch Release Bearing Assembly and Concentric Slave Cylinders

The special design of the **clutch release bearings** permit maximum speeds at maximum loads. The design has also been proven to have the long life. **Anti-rotation feature** prevents rotation damage to carrier in constant running applications. It consist of solid steel roll-pin across the bearing fork-groove. This **variable contact design** assures a longer life and minimizes noise and vibration. The seal consist of separator and bore liner that excludes contamination and retains grease.

This combined **hydraulic slave cylinder** and thrust bearing assembly is designed to operate directly in front on the clutch cover assembly.

The unique design eliminates the need for complex and sometimes expensive clutch release fork and linkage mechanisms.

Having direct hydraulic load applied to the clutch via the master and concentric slave, provides less pedal effort, and over comes the possible loss of bearing travel due to wear, often associated with conventional linkage or cable type systems.
